Files and Links

S.No	Name	Description	Link	Owner
1	Figma File	Figma file containing the design requirements for the website.	https://www.figma.com/design/S5rbZ87QN53IAIx7b8dy6y/POR -Website_2024?node-id=2969-328&t=V3NzISU2jdqbgusg-0	Plan of Record
2	GitHub	Github link containing the code	https://github.com/planOfRecordXYZ/staging_site	Plan of Record
3	Test site 1	Initial deployed site (version 0.1)	http://planofrecords.rf.gd/index.php	Hanna George
4.	Admin test site	Initial site with admin functionalities (version 0.1)	http://planofrecords.rf.gd/admin/projects.php	Hanna George
5.	Test site 2	Updated deployed site (version 0.2)	http://planofrecord.42web.io/	Sravani Singani
6.	Admin Test Site 2	Updated site with admin functionalities (version 0.2)	http://planofrecord.42web.io/admin/login.php	Sravani Singani

Frameworks and Packages

Boxicons: Displaying certain icons like plus and minus, right arrow in projects.php

Bootstrap: Framework used to style the admin pages.

Admin Credentials

Email - info@planofrecord.xyz

Password - por@#123

Email - admin@test.xyz (only for test purposes, can get rid of it)

Password - admin@#123

Database Details

The PoR website is making use of MySQL for storing, retrieving data and performing CRUD operations. The database details are mentioned below. You can find a sample SQL file in the GitHub repository.

Database: MySQL

Database Name: planofrecord

Tables: projects, images, layout, admin_users

Projects Table

This table is used to store all the details of a project

project_id: Primary key to store ID

client: Client name of the project, Used as main title for the projects

description_short: Short description for the project used in project listing page (projects.php)

description_long: Longer description explaining the project in detail

type_of_work: Depicts the type of work done for the client. Used for filtering in project listing page

industry: Depicts the type of industry the client belongs to. Used for filtering in project listing page

year: The year in which PoR worked on the project

addedTime: system generated time to store the time in which the insertion took place. The projects are currently displayed in the descending order of these values so that the project added most recently will be on the top.

descriptionBlock: This column is meant to store a secondary description block for the project page. The functionality for this column hasn't been implemented in v0.1.

Images Table

This table stores all the images and video media used in the website.

Image_id: Primary key

Project_id: Foreign key used to access projects table

Image_url: Media file names of the image/video used. The code will fetch these names and search it in the uploads folder to find the file with that name. ImageUrl should not have spaces in it.

Type: This is used to denote if the image is a Thumbnail, Hover_image or project-image. The Thumbnail is ideally a video but it can also accept images. Hover image was made as part of initial project pitch, the functionality intended to display an image on hover which is why I created a type called Hover, but this functionality is not needed at the moment so it can be neglected. For future scope if this functionality is needed, you can fetch an image with type= Hover_image. And finally, Project-image is used to store all the other media for a project.

Alt_text: used to store alt text values.

Layout Table

This table is used to store the layout structure and media layout of the structure.

Id: Primary key

Project_id: foreign key to access project

Layout_data: This is a JSON text used to store the layout of how each block is placed. For example: `[["block1"],["block2"],["block3","block3"],["block3","block3","block2"]]`

The above Layout Data will be placed as follows

`[“block1”]`

`[“block2”]`

["block3"] ["block3"]

["block3"] ["block3"] ["block2"]

Where block1, block2 and block3 are the html id values of the block that is being dragged and dropped to the container

Media_assignments: This is again a JSON text which follows the same logic as above. Instead of block ids this column stores the filenames of the media.

Admin Users Table

This table is used to store the admin details for login credentials.

Id: Primary Key

Username: Represents the username selected by the admin (Can also take in full name and is not used in the login form). User names are displayed in the Manage Users Page, listing out the admins present in the database.

Email: It is used to store email id of the admin and is a necessary field in the login page.

Password: The password field stores the hashed password for security purposes. The admin can conveniently add a new admin in the Manage Users page.

PASSWORD_BCRYPT is used while registering a new admin to store a hashed password into the database. In future the password security can be enhanced by adding salt to the bcrypt password.

Password_hash_token: The column is set to null and was created in case the admin wants to retrieve their forgotten password. **Currently, no forgot password functionality has been added.**

Token_expires_at: Is set to null and represents the time until which the password_token is active. **This field is also not in use, but added for future adjustments.**

Created_at: This column stores the timestamp when an admin has been registered.

Pending Works

Priority	High	Medium	Low
----------	------	--------	-----

□ **Project Setup:** Setup their current projects for the index page of 'PoR' website either using admin page/ directly updating the database (as some media have issues uploading directly through form).

□ **Media compression on upload:** Perform media compression while uploading images, in case the files are too big to upload.

□ **Forgot Password:** EmailUS can be used (optional, as the previous dev has used EmailUS on PoR Contact Page) to send a link to change their password. Might have to create a template to make it accessible through code.

*A logged in user can change their password from the 'Manage Users' page.

□ **Testing:** I have performed most of level-0 testing.

- Conduct more tests on admin login functionality and CRUD, cross-check the database reflections.
- Perform add and update project with multiple media files and sizes. Currently there are size limitations while uploading media files of bigger size (could be php limitations).
- Check if any issues in CRUD navigate to the error page correctly.
- Check for any paths and links that might be affected when deployed.
- Responsive design has been coded and tested for a set of screens but was limited. Conduct a responsive design test for different screens and cross-browser compatibility.
